In 48 BC, Alexandria became the most important center of learning in the ancient world. Erected in 400 BC and dedicated as a library, it contained an enormous collection of texts and remained the largest library in the world until Baghdad surpassed it in 800 AD. The Library of Alexandria contained the world's largest collection of books and scrolls and it was overseen by scholars and teachers, many of them part of a secret brotherhood with members known as the "Sons of the Muses." The scrolls came from as far away as India, China, Persia, and the Middle East and the library was famous not only for the breadth of its collection, but also for

the expanse of its holdings. Among the works held in the library were the complete collection of works of Aristotle, some of the earliest surviving copies of the Bible and the writings of Homer, Euclid, and Ptolemy. Unfortunately, despite its great importance, the library was destroyed by Romans in its seventh century AD. Chances are you're a regular reader of tech news but a new article caught my eye today. A site called ComputerWorld ran a piece about who you can thank for the Pentium Pro... wait, sorry, the Pentium II, that's the processor which just doubled the performance of desktop computers for the first time. Dan Fitzgerald, a Prof of Computer Science at the University of Minnesota was awarded the patent for the processor design which is, as you might have guessed from the Pentium name, code-named Venison. The design of the processor was developed in the 1980s, and Fitzgerald and his co-workers had intended to patent it. However, the company that designed the processor (Intel) obtained the patent first. Fitzgerald had a problem with the patent, so he sued Intel and won. The
