While Elements has been around for a long time, it has yet to be supplanted by a new version or improved function. The early versions of Photoshop looked similar to the Elements versions of the time. Despite recent improvements, it's still not clear if Elements will survive to see the next version of Photoshop. To see if this is the case, we'll have to look at some of the improvements and what areas are lacking in Elements. 1. Pixels The first thing to look at with Elements is the "Pixels" feature and the associated feature set. Pixels is the foundation on which Photoshop layers are built. It allows you to create, move, copy, and organize layers, just as you would with a photograph. Additionally, pixels is where the vector and raster components of graphics are separated and where blending modes are introduced. While on professional level Photoshop, pixels can be combined to create different effects such as blurred or zoomed images. This feature is very similar to the one in Windows 7. In the feature set, Windows 7 allows you to add or subtract pixels, change the size of images, add images and change the color of pixels. Pixels has been the foundation of the Windows 7 feature and allows for complex blending modes such as 'chrome' or 'overlay'. Like Windows 7, the feature set on Photoshop Elements is similar to the Windows OS on a personal level. For example, you can change the brightness and contrast, add images, or create a slideshow. The screenshot below shows the differences in pixel options. 2. Layer List The second way in which Elements compares to Photoshop is the Layer List. The Layer List shows all of the existing layers, the layer tools and masking tools available for that particular layer. In Photoshop you can also manipulate the individual components of the layer, by adding, moving, and deleting layers, as well as blending and masking. Elements also features the ability to manage the list, but at a much more basic level. If you want to delete a layer, you must find it by moving the mouse over it and right-clicking. Instead of using a drop-down list to select individual layers and delete them from the screen, you must drag and drop individual layers. To delete a layer, move the drag pointer over a layer and release the mouse. Photoshop displays a number 05a79ccff
